

## IS 475/675 - HW #1

1)

a. Customer is a strong entity because it is independent of its relations to Does Business In and Order (requires a minimum cardinality of zero).

b. Order is a weak entity because it is dependent on both Customer and Order Line (requires a minimum cardinality of one).

c. The purpose of the Works In entity is to express a potential many-to-many relationship between Employees and Work Centers.

d. Since an Employee can work in zero to many work centers and a Work Center can have one to many Employees working in it, there must be an associative entity in between the two entities (Works In) to express the potential many-to-many relationship.

e. The Works In entity is an associative entity so its primary key is the composition of the Employee foreign key (Employee ID) and Work Center foreign key (Work Center ID).

f. A non-key attribute that may be stored in the Works In entity would be Time Worked.

g.

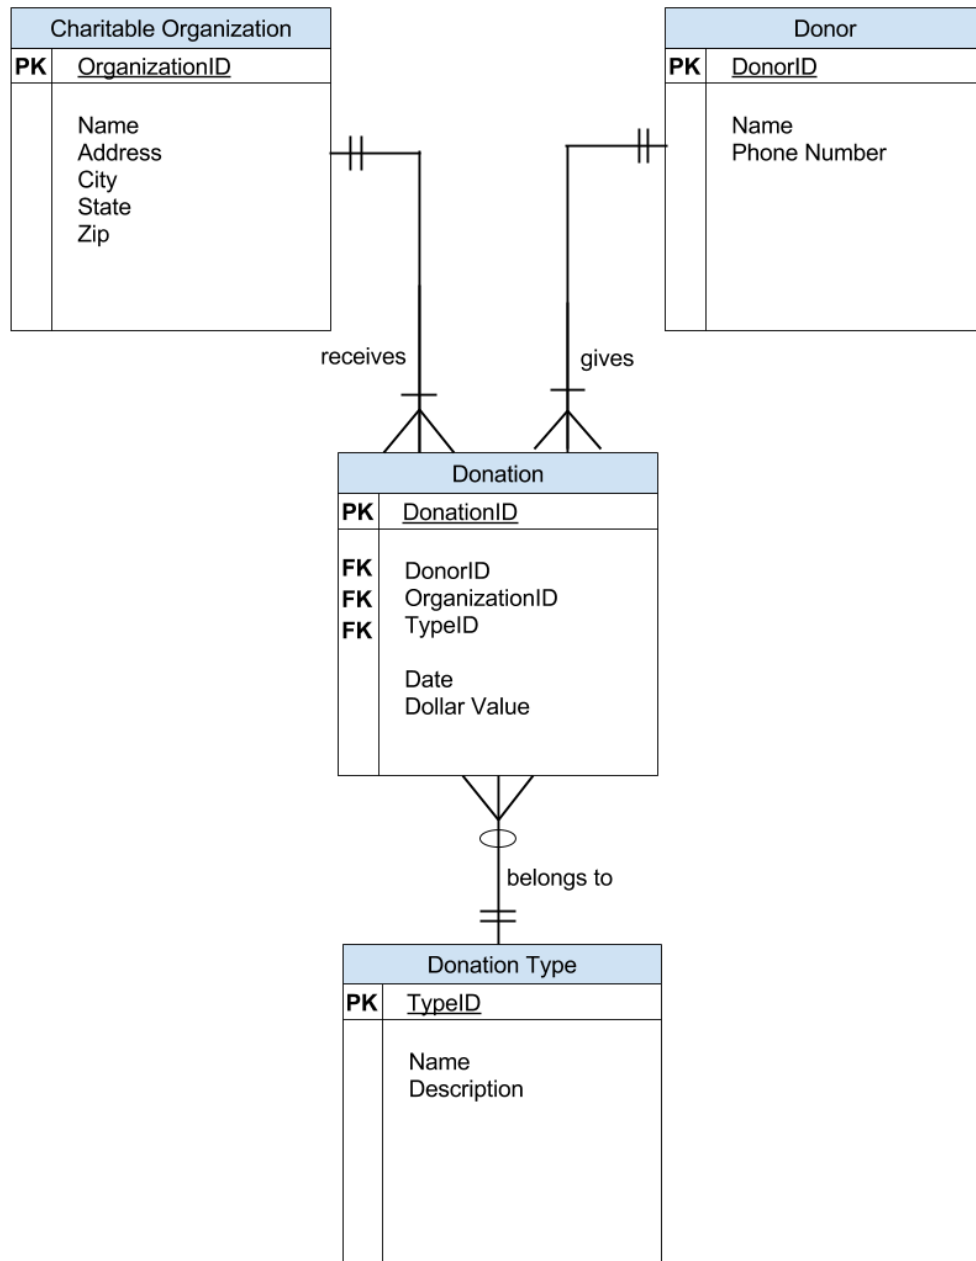

WORK CENTER	
<u>Work Center ID</u>	Work Center Location
1	Front
2	Side
3	Back

EMPLOYEE		
<u>Employee ID</u>	Employee Name	Employee Address
1	Amy	1234 Main St. Reno, NV 89501
2	Bob	1234 First St. Reno, NV 89502
3	Carol	1234 Second St. Reno, NV 89503

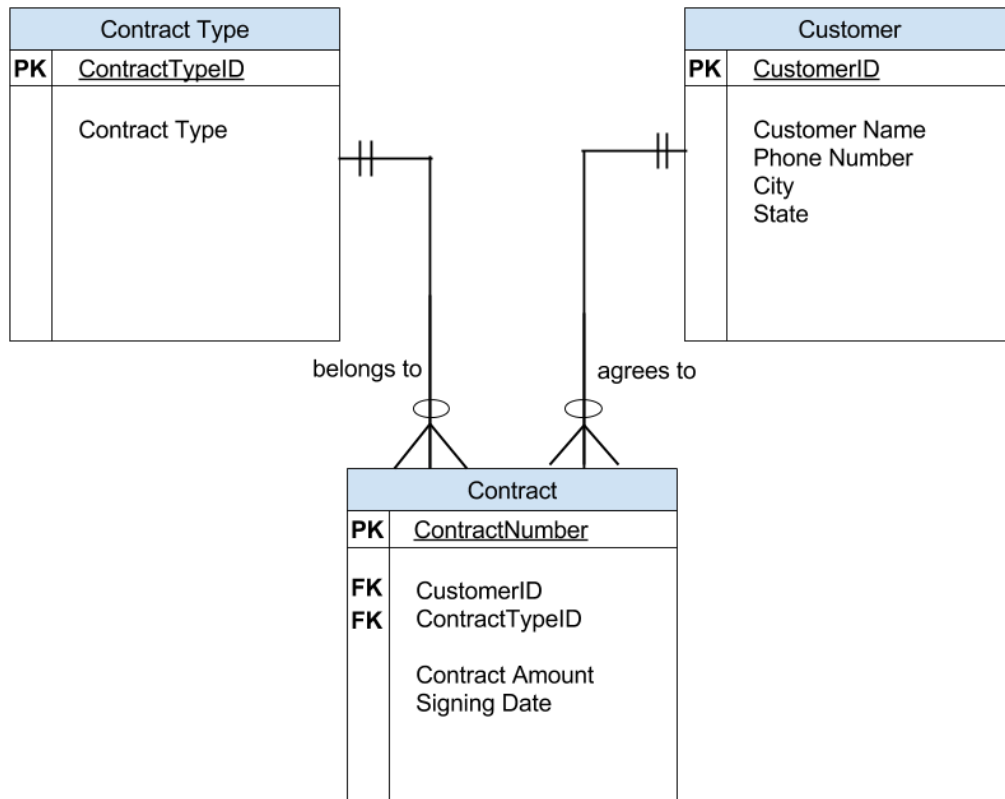

WORKS IN		
<u>Work Center ID</u>	<u>Employee ID</u>	Time Worked
3	2	5
2	1	10
1	3	15

h. Employee Name and Employee Address are both composite attributes because they have information that can be utilized further upon dissection. For example: Employee Address = 1234 Main St. Reno, NV 89501. Each piece of information extracted (Street Address, City, State, Postal Code) is a component attribute which is a detailed meaningful bit of information.
